7th CERES-II Meeting  
Newport News, Virginia.  
April 24-26, 2007

## Background:

CERES SARB (*Surface and Atmospheric Radiation Budget*) retrieved TOA and surface albedo (*CRS Ed2b*) over snow have shown significant bias to the surface (ARM, CMDL) and TOA (CERES) observations.

Except for the surface roughness effect, a possible major error source is **the surface albedo, especially the spectral shape**, used in the retrieval.

The snow surface albedo LUT in SARB retrieval was created by the radiative transfer model, so model validation and improvements are required.

7th CERES-II Meeting  
Newport News, Virginia.  
April 24-26, 2007

## Outline:

1. Snow optical properties.
2. Validation of radiative transfer model with quality surface measurements (*Hudson et al., 2006*).
3. Comparison with MODIS/CERES radiances.
4. Model application to snow grain size retrieval for CERES SARB.

7th CERES-II Meeting  
Newport News, Virginia.  
April 24-26, 2007

# 1. Snow Optical Properties

Compare the snow optical properties (extinction, absorption, and scattering asymmetry factor) for the four snow particle shapes:

Sphere

Aggregate

Plate

Solid  
column

Effective radius:  $Re = 0.75 \text{ (Volume/Project-area)}$

7th CERES-II Meeting  
Newport News, Virginia.  
April 24-26, 2007

Extinction cross-section for unit mass of snow (cm²/g).

$$Re = 0.75V/A$$

Single scattering co-albedo and asymmetry factor for the four particle shapes as a function of wavelength.

$Re = 100$  (micrometer)

Comparison of the albedo for the four particle shapes.

## 2. Comparison With Surface Measurements

Compare the measured spectral surface albedo and the anisotropic reflectance factor (ARF) (i.e., radiance distribution or ADM) with model for the four snow particle shapes.

Measurements are from Dome C, Antarctic by *Hudson et al.* (2006).

7th CERES-II Meeting  
Newport News, Virginia.  
April 24-26, 2007

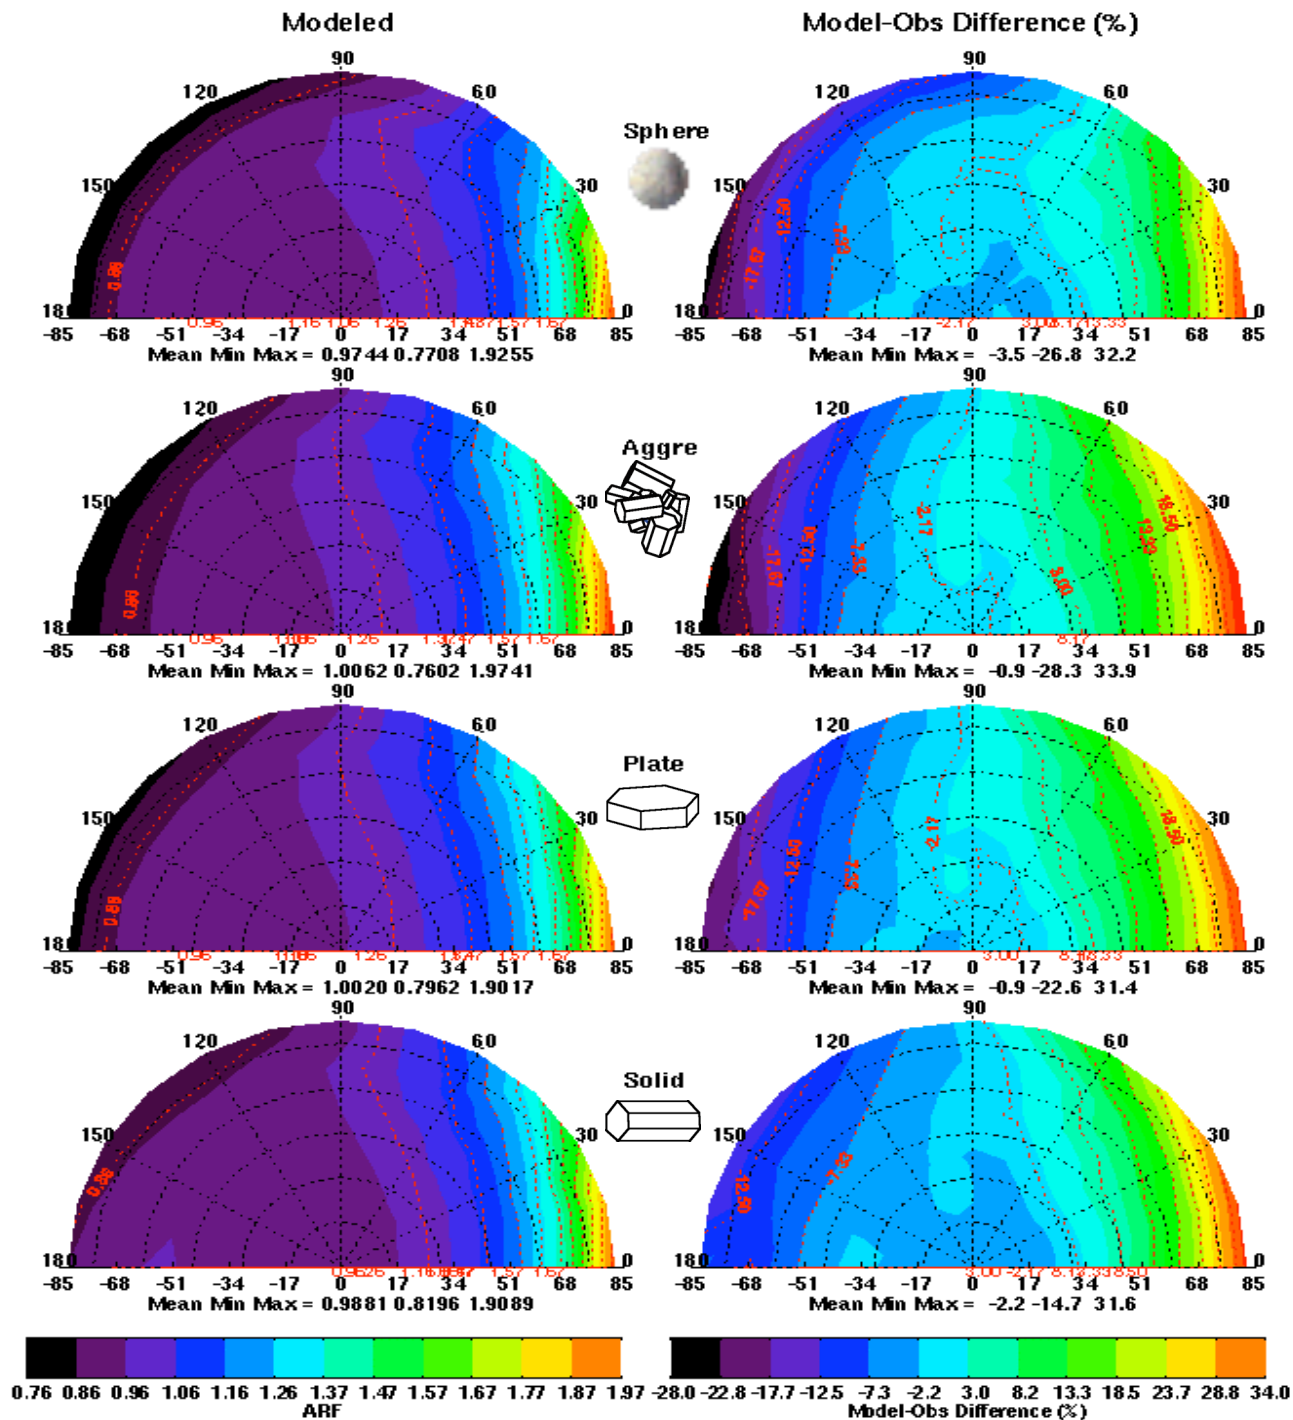

Snow spectral albedo can be matched well with a two-layer snow model regardless of the particle shape.

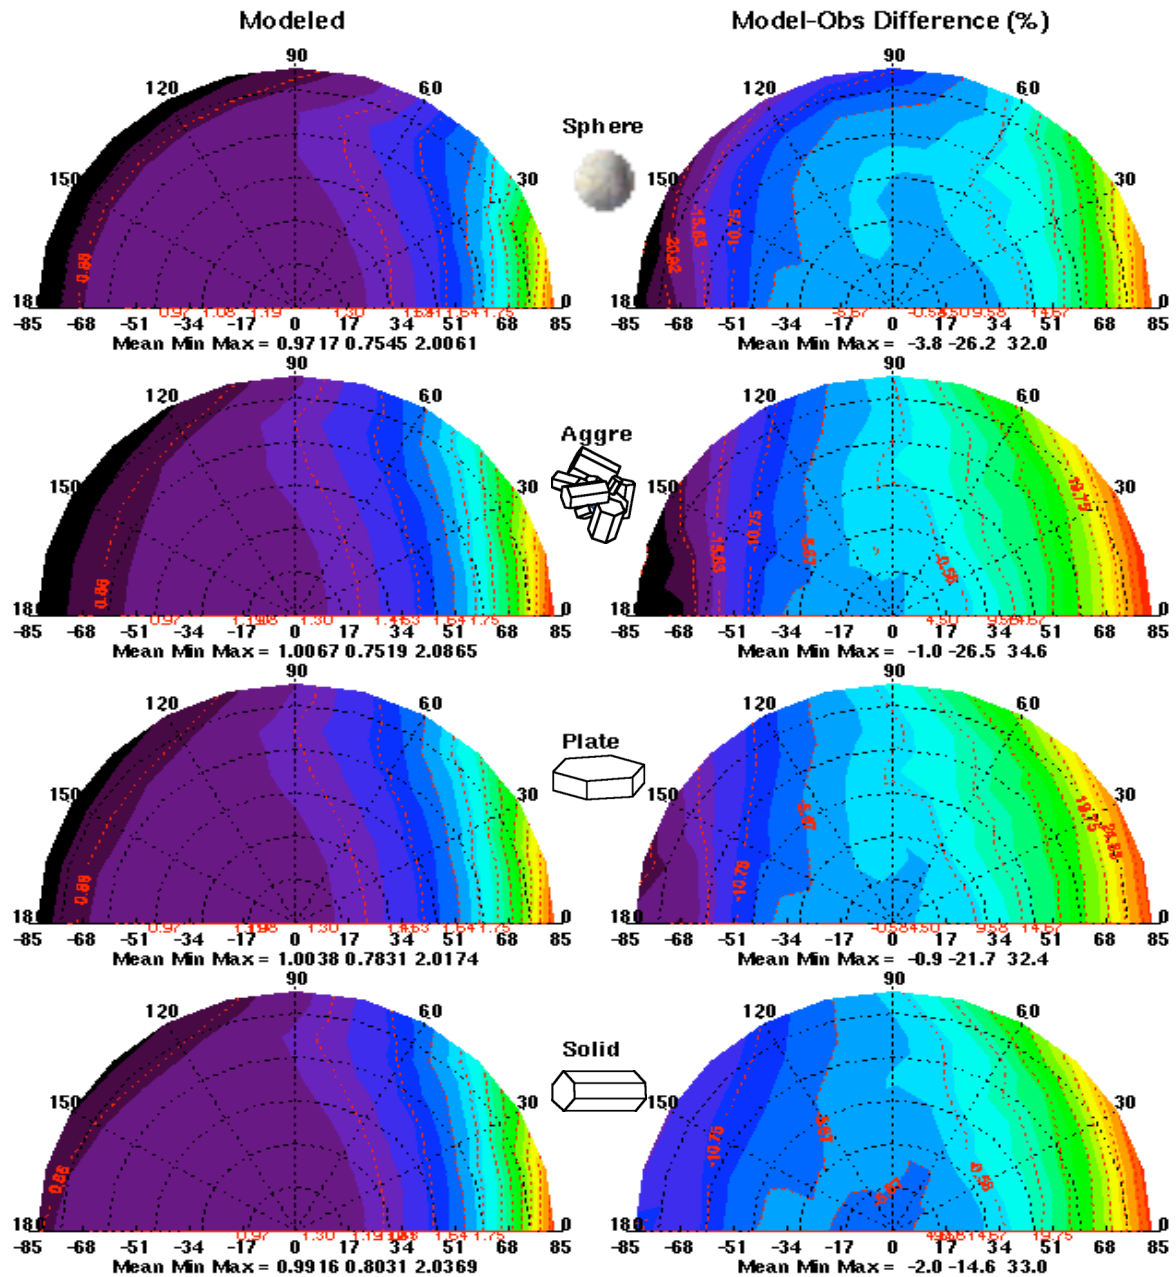

April 24-26, 2007

Modeled surface radiance distribution (left) and relative difference from surface measurement (right) for the four particle shapes.

The same two-layer models as used for the spectral albedo simulations are used.

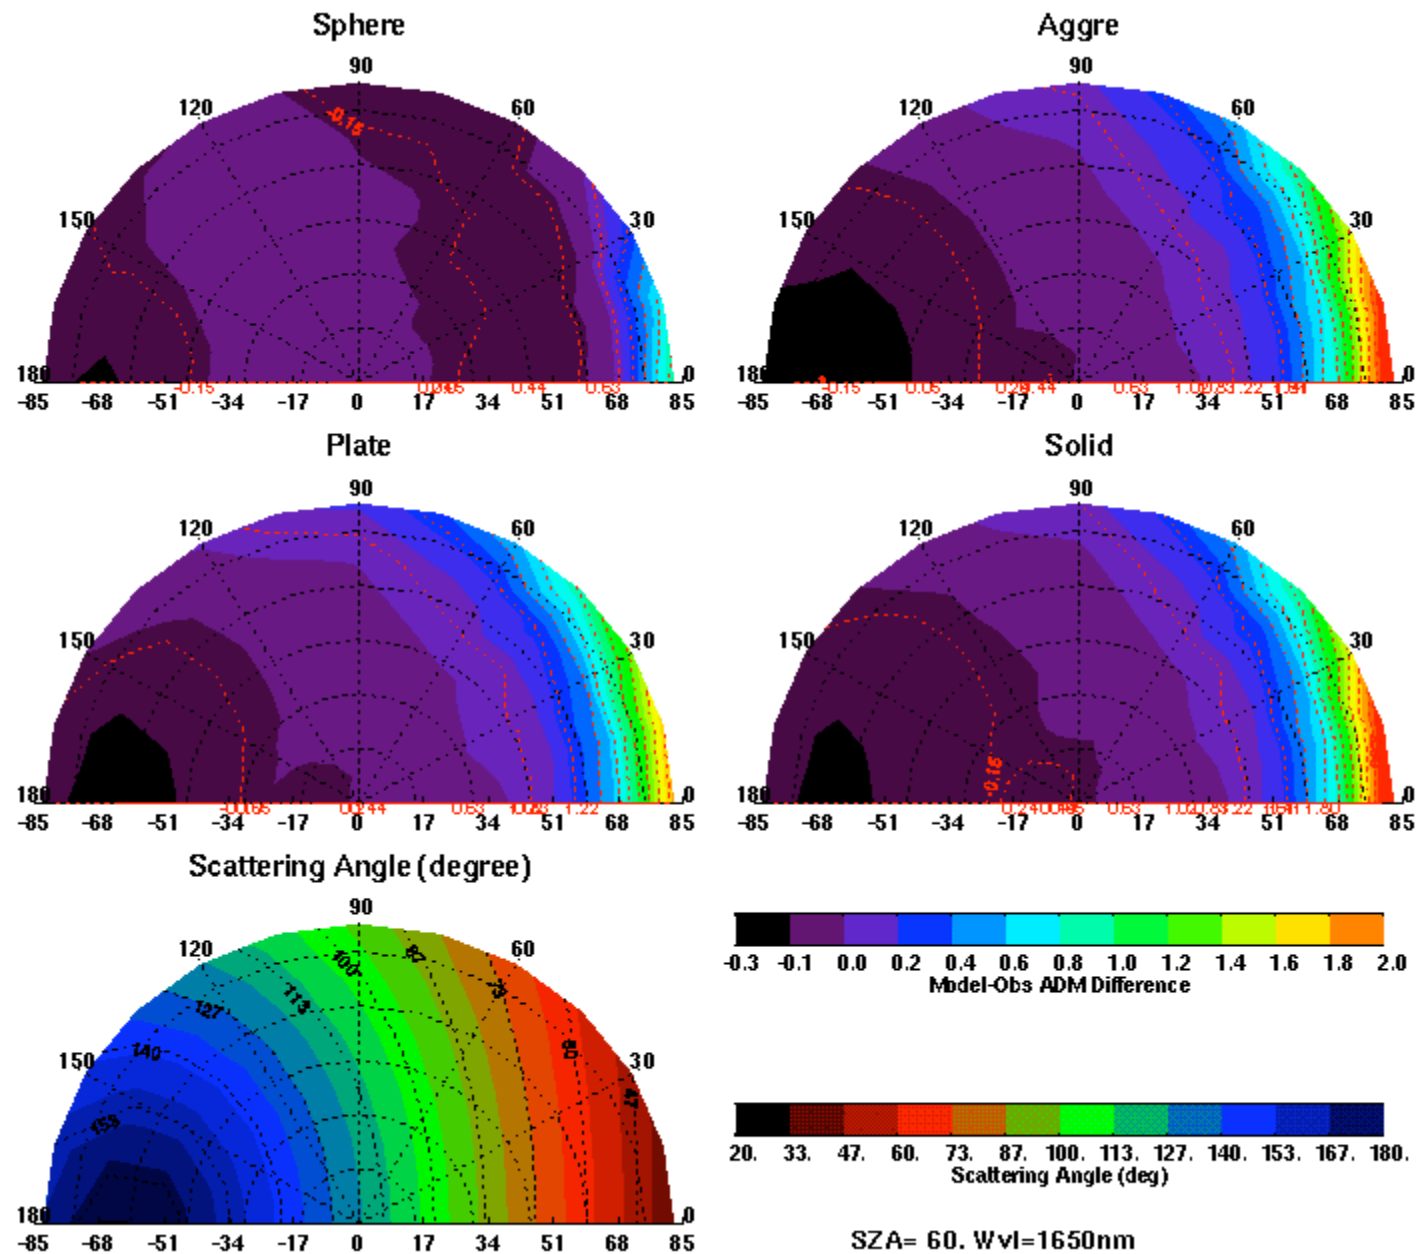

SZA = 60. Wvl = 850nm

ARF difference  
at 1.65um for the  
four particle  
shapes.

Scattering angle

7th CERES-TM Meeting  
Newport News, Virginia.  
April 24-26, 2007

### 3. Comparison of MODIS/CERES Radiances With Model Simulation

is selected for the radiative transfer simulations of MODIS/CERES radiances.

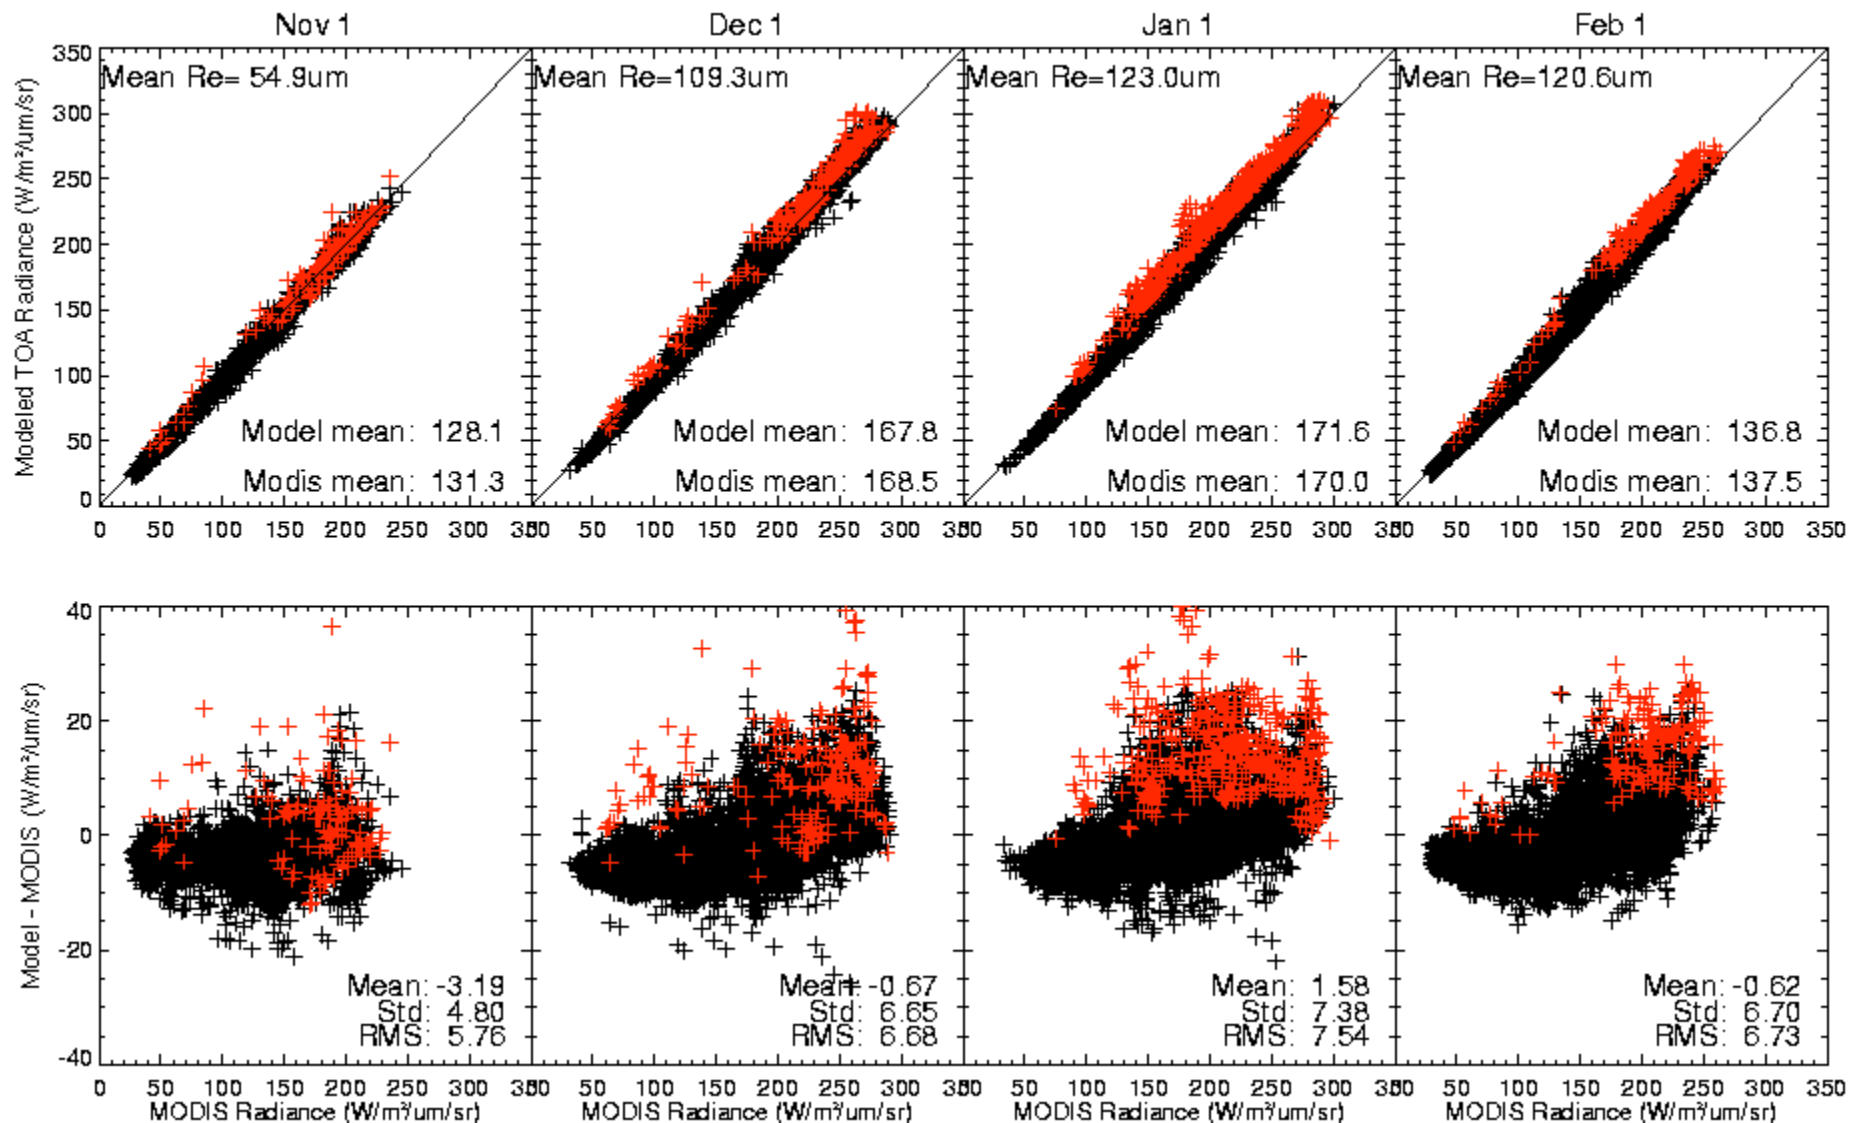

CERES/MODIS data selection criteria:

- 1) *Clear fraction = 100%*
- 2) *100% snow in each footprints*
- 3) *Relative STD of imager radiances < 3%*
- 4) *T\_surface < 270°K for snow surface*

Data for the examples below are from Antarctic plateau, where water vapor and aerosol effects are small.

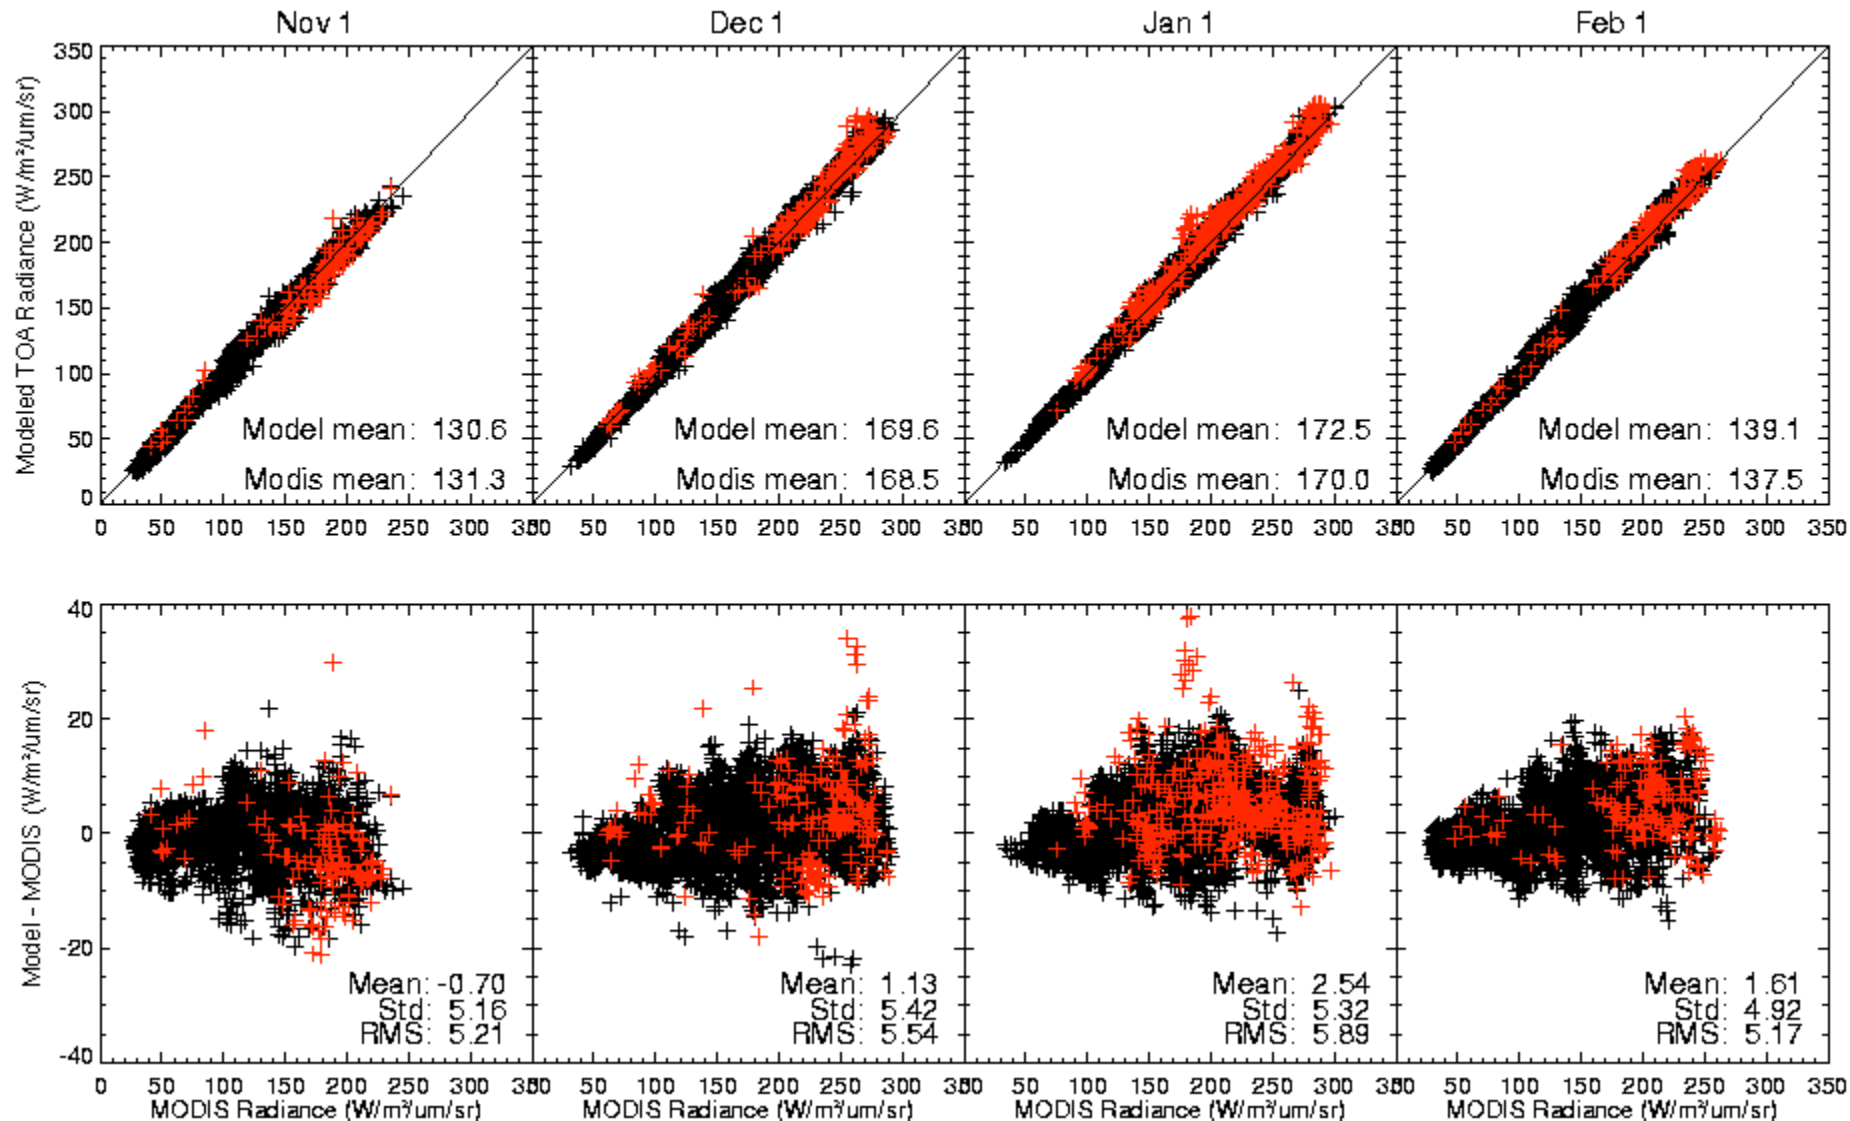

## MODIS-Model Radiance Comparison Over Snow (0.64 $\mu\text{m}$ )

7th CERES-II Meeting  
Newport News, Virginia.  
April 24-26, 2007

# MODIS-Model Radiance Comparison Over Snow (0.64 $\mu\text{m}$ ; use measured BRDF in model)

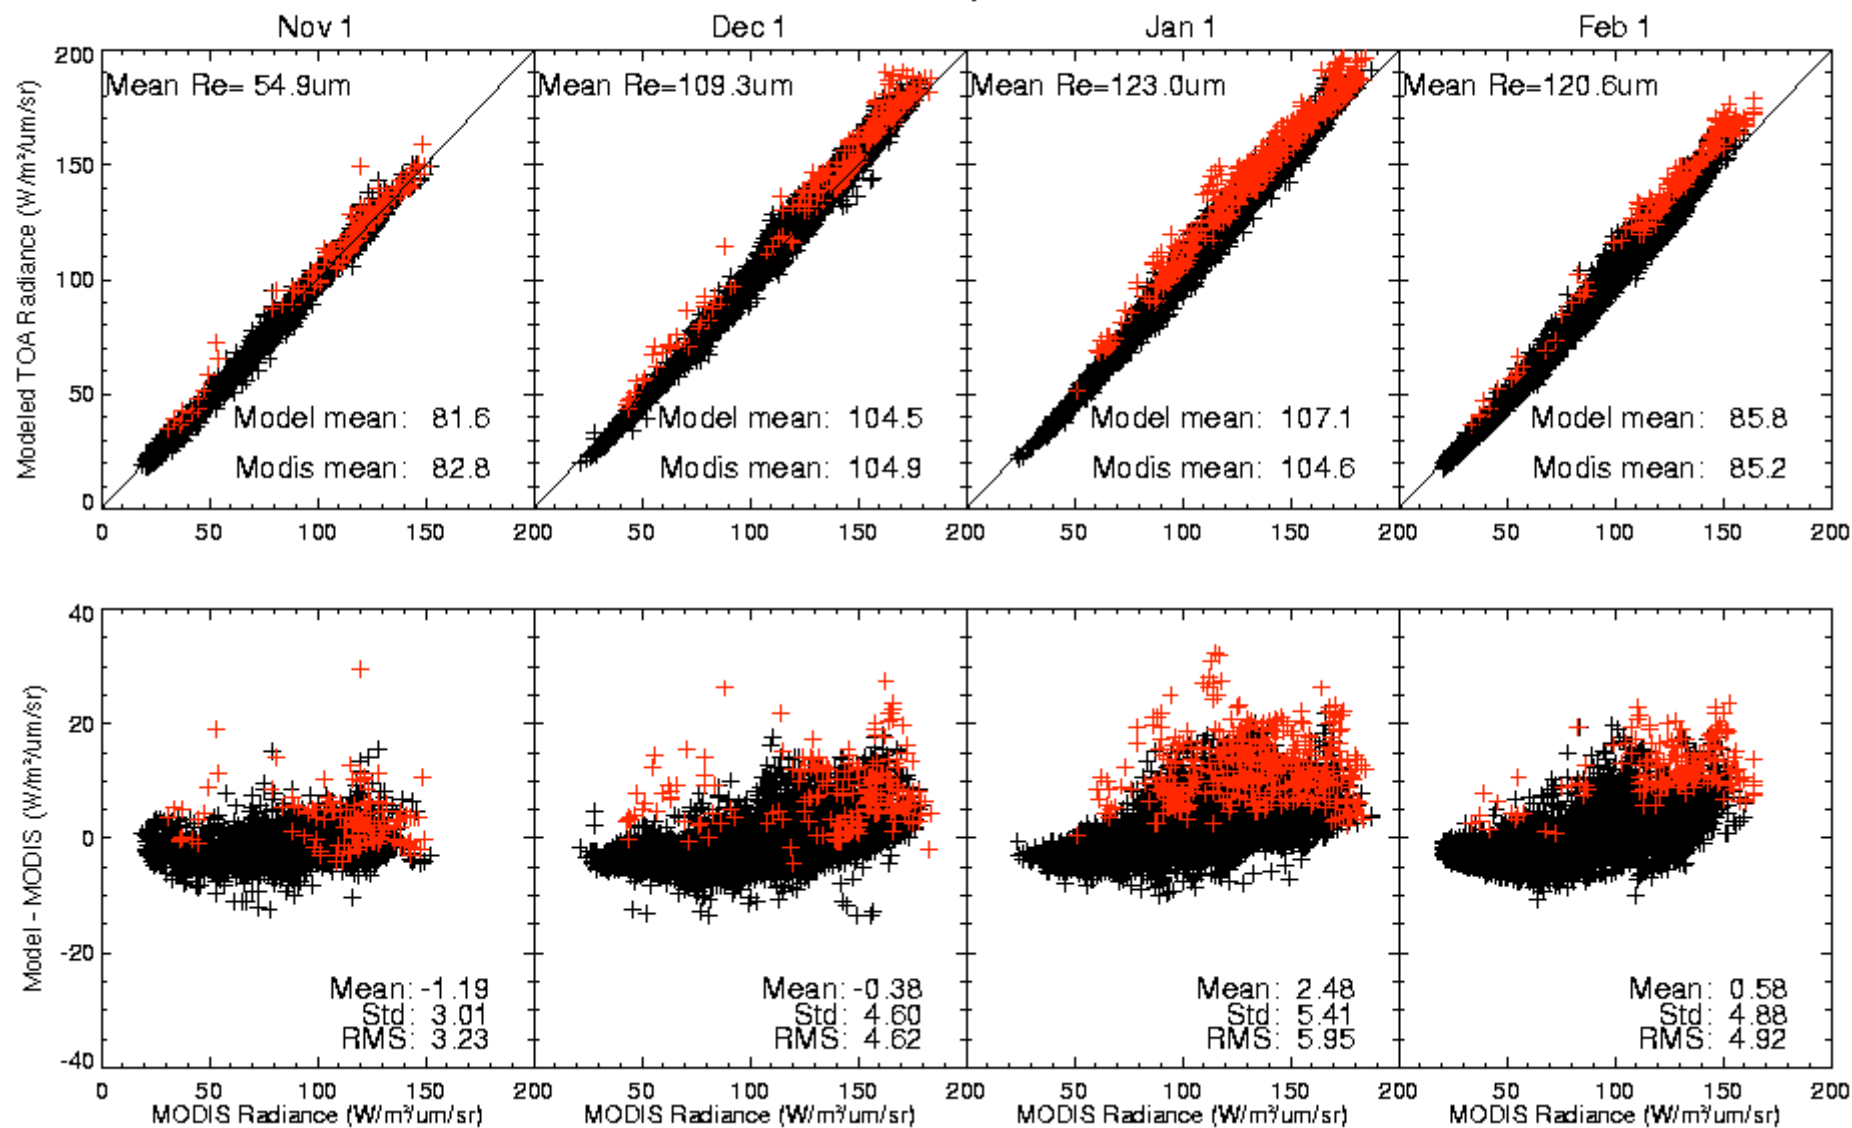

7th CERES-II Meeting  
Newport News, Virginia.  
April 24-26, 2007

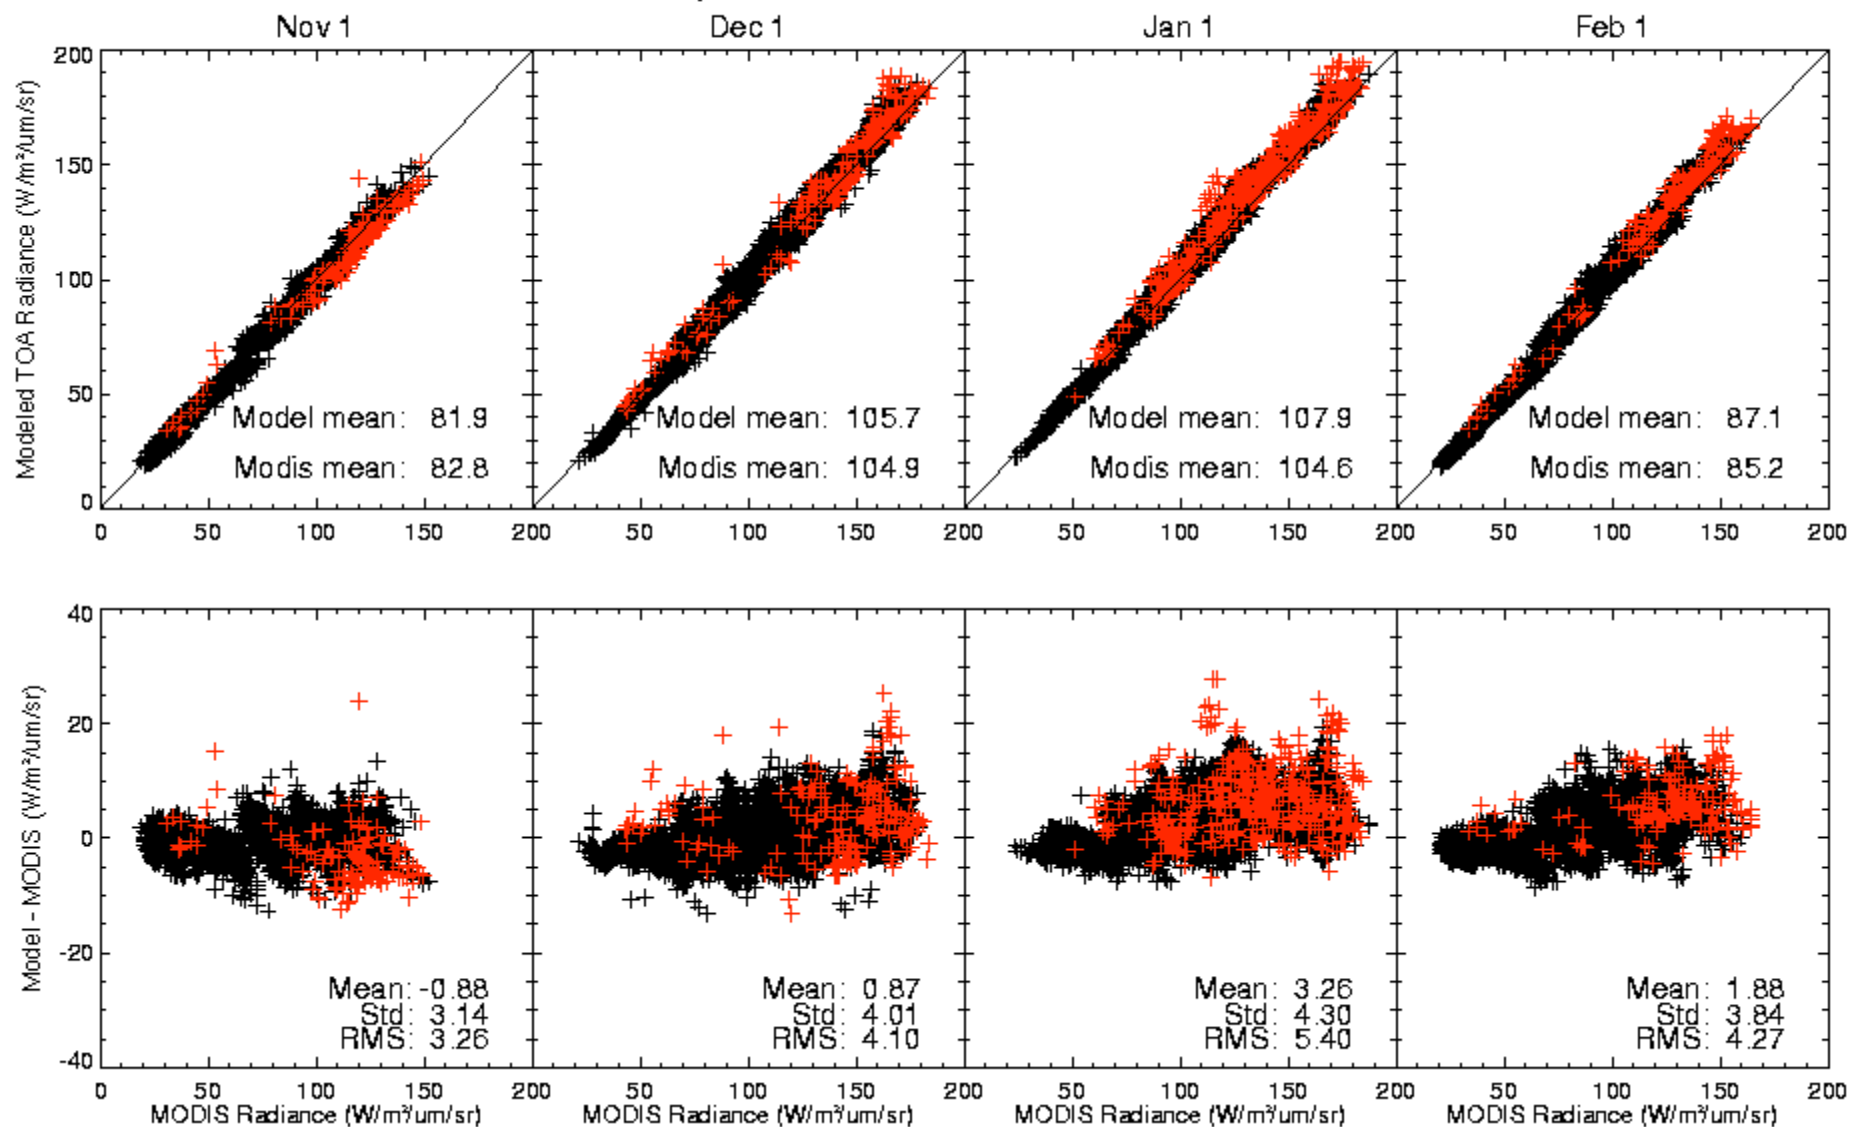

# MODIS-Model Radiance Comparison Over Snow (0.86 $\mu\text{m}$ )

7th CERES-II Meeting  
Newport News, Virginia.  
April 24-26, 2007

# MODIS-Model Radiance Comparison Over Snow (0.86 $\mu\text{m}$ ; use measured BRDF in model)

Newport News, Virginia.  
April 24-26, 2007

# CERES-Model Radiance Comparison Over Snow (Model only)

7th CERES-II Meeting  
Newport News, Virginia.  
April 24-26, 2007

# CERES-Model Radiance Comparison Over Snow (Use measured BRDF in model)

7th CERES-II Meeting  
Newport News, Virginia.  
April 24-26, 2007

7th CERES-II Meeting  
Newport News, Virginia.  
April 24-26, 2007

## 4. Snow Grain Size Retrieval for CERES SRAB

Snow grain size ( $R_e$ ) determines the spectral albedo and albedo shape.

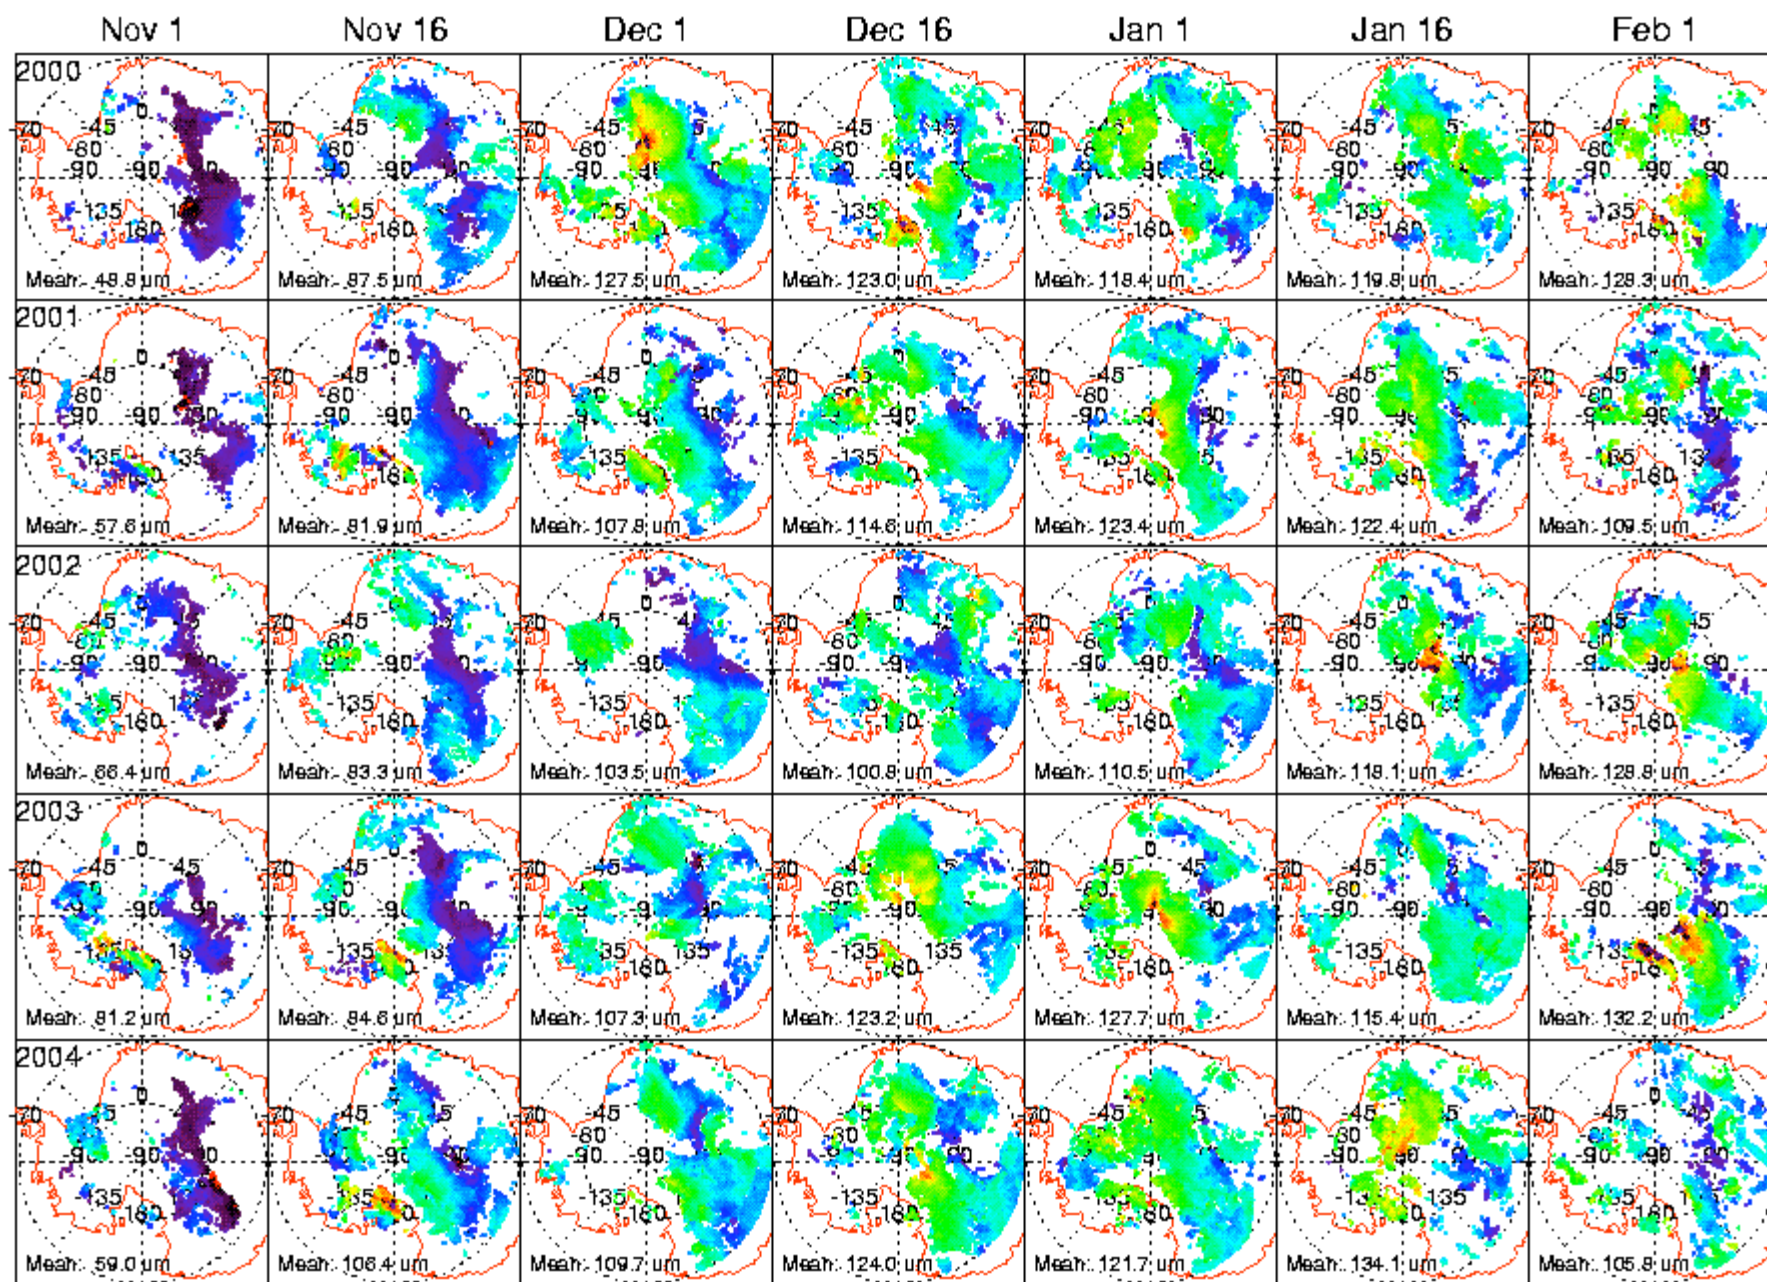

Using grain size retrieved from MODIS data and a two-layer snow model will provide a more accurate spectral surface albedo for the next version of CERES SARB.

Newport News, Virginia.  
April 24-26, 2007

# Summary

- New set of snow optical properties are created and tested, and are implemented in the radiative transfer model.
- Except for some extreme view geometries, the model-observation radiance comparisons show good agreement.
- Results suggest that a two layer snow model need to be applied in the next version of CERES SARB retrieval to have a correct spectral shape of snow albedo.
- The spectral shape is mainly determined by the top layer of snow grain size, which can be retrieved through MODIS reflectances.
- The results suggest that the observations from those extreme large view angles should be avoided for grain size retrieval.
- Initial results of the grain size retrieval are promising, but further check on pass by pass consistence is required.

7th CERES-II Meeting  
Newport News, Virginia.  
April 24-26, 2007

## Acknowledgments:

We thank Dr. Stephen Warren's group at University of Washington for the snow surface measurement data; NASA Langley DAAC for CERES/MODIS data; and Grant Matthews for the updated CERES calibration.
